

Documenting the Vietnam Era Twin Study of Aging: Balancing Act

Carol E. Franz

University of California San Diego

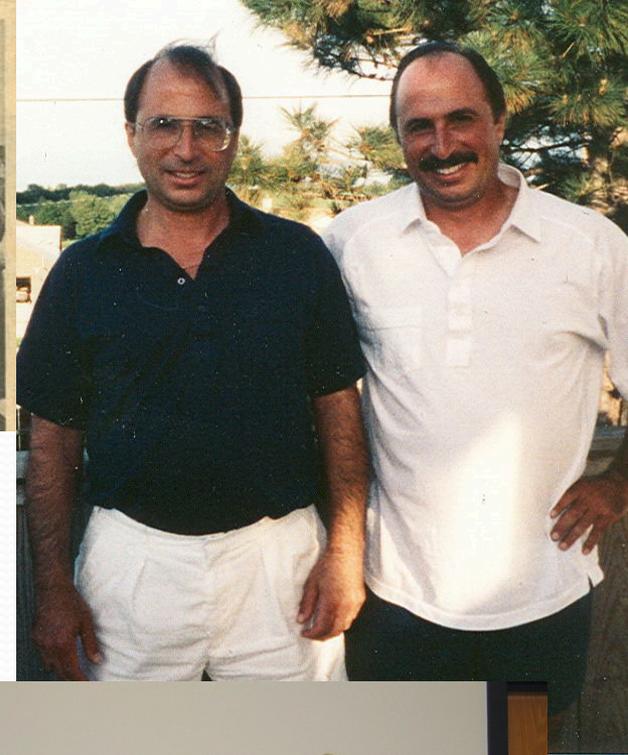

Annual NADDI meeting at the University of Wisconsin,
April 10, 2015

Supported by NIA R01s: AG018386, AG018384, AG022381,
AG022982 , and R03 AG037985

- Time to think in a different way about “social sciences data.” It’s more than surveys and questionnaires.
- Many studies ideal for DDI are not in the planning stage or at the beginning. Most have already completed data collection or have years of longitudinal data.
- Many have multi-modal data (self-report, interviewer, biomedical tests, biospecimens, experimental data, in-person cognitive testing, imaging).
- Today: Perspective from the Vietnam Era Twin Study of Aging (VETSA). A longitudinal study of risk and preventive factors affecting cognitive decline, starting in mid-life.

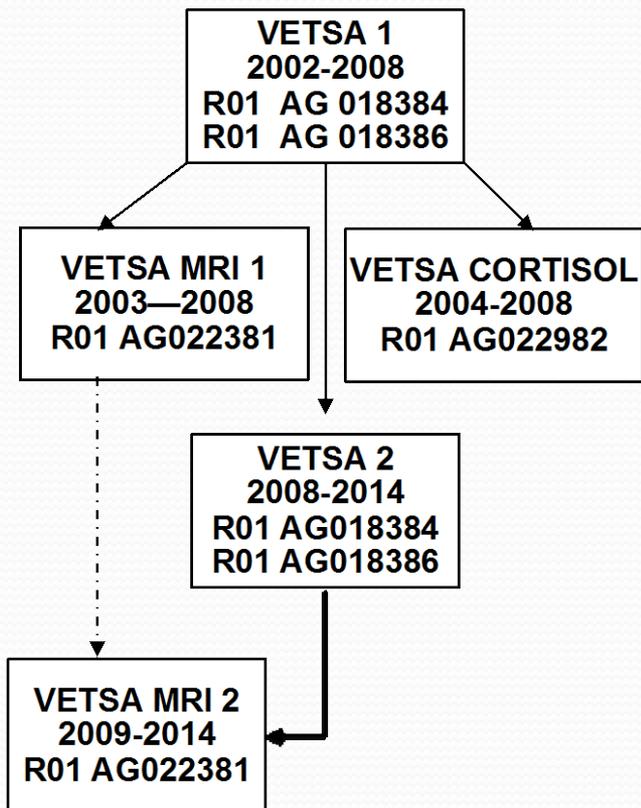

1237 individual male twins at VETSA 1

- Age at VETSA 1 assessment: 55.4 yrs (range 51-60)
- Community dwelling non-patient sample
- 10-12 hrs of assessment: SR questionnaires, in-person interviews and tests, screenings, imaging, biospecimens.
- Previous data available but not publicly accessible

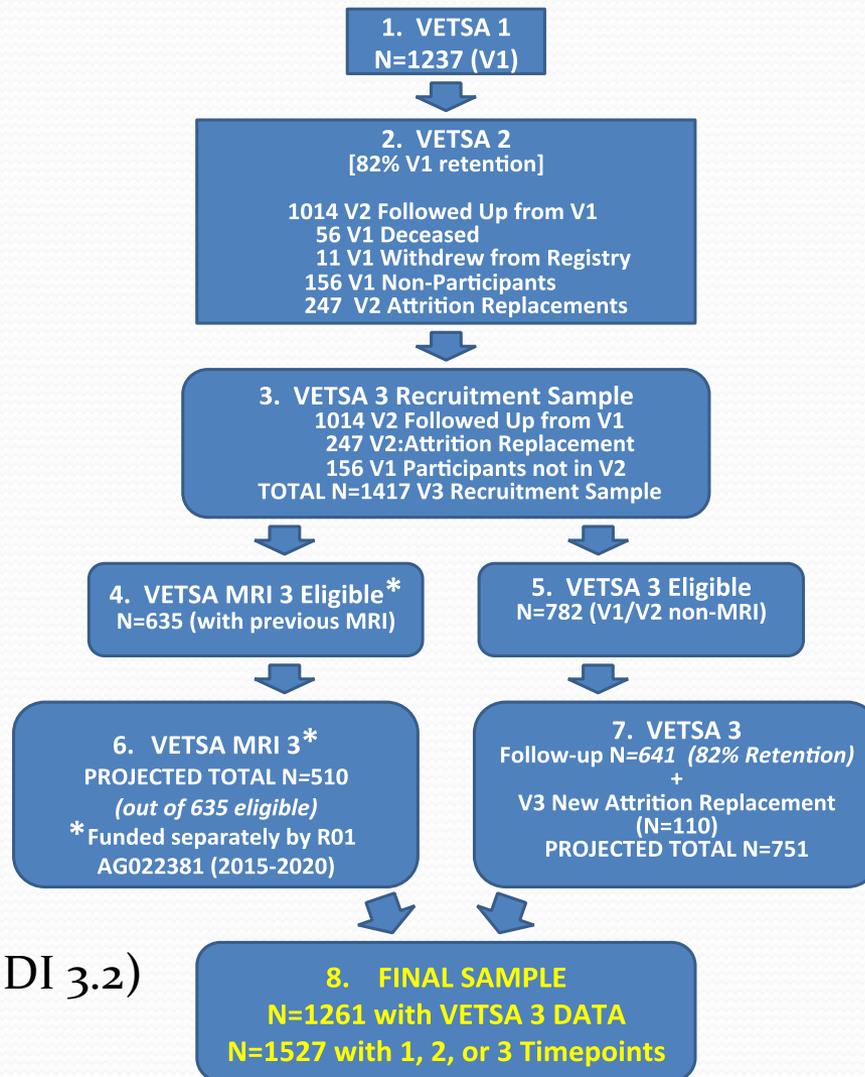

HS Figure 1: Completed VETSA Data Collections

~4500 variables at baseline
(now documented in Colectica Designer/DDI 3.2)
~3500(+++) variables VETSA 2

HS FIGURE 2. Recruitment Flow Chart

Users
e.g. Secondary data
analysis
Archives
Research data
services

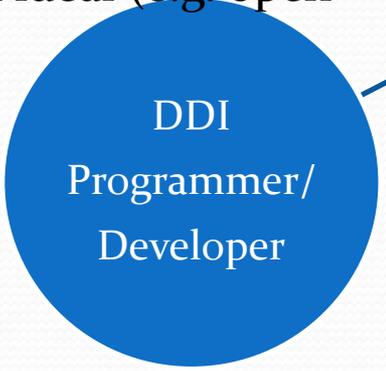

Original
Investigators

- Goals/needs
- Do good science (get grants)
 - Publish or perish in academia
 - Do more good science (get grants)

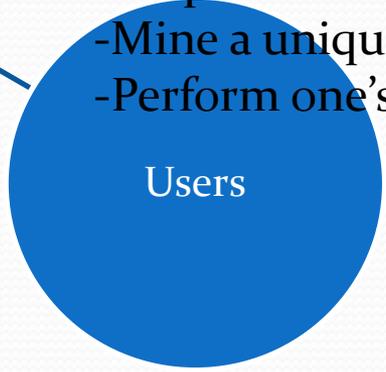

Data

DDI
Programmer/
Developer

- Master challenges/problems
- Work towards an ideal (e.g. open data)

Users

- Goals/needs
- Publish or perish
 - Do pilot work to get grants or publish
 - Mine a unique dataset
 - Perform one's job well

Good science/good publications need to know:

- Quality of research methods
- What measures
- How assessed
- How scored
- Any details essential to:
 - Understanding reliability and validity of the measures;
 - Interpreting results
 - Evaluating similarities and differences of results compared with other studies.
 - In some cases, enough detail to be able to replicate and extend that study through conducting a new study.

- 
- **Can (or should) DDI meet the needs of current social science? (Walk a mile in my shoes.....)**
 - Dorothea:
“DDI was built on things that fall naturally out of data”

~NOT~

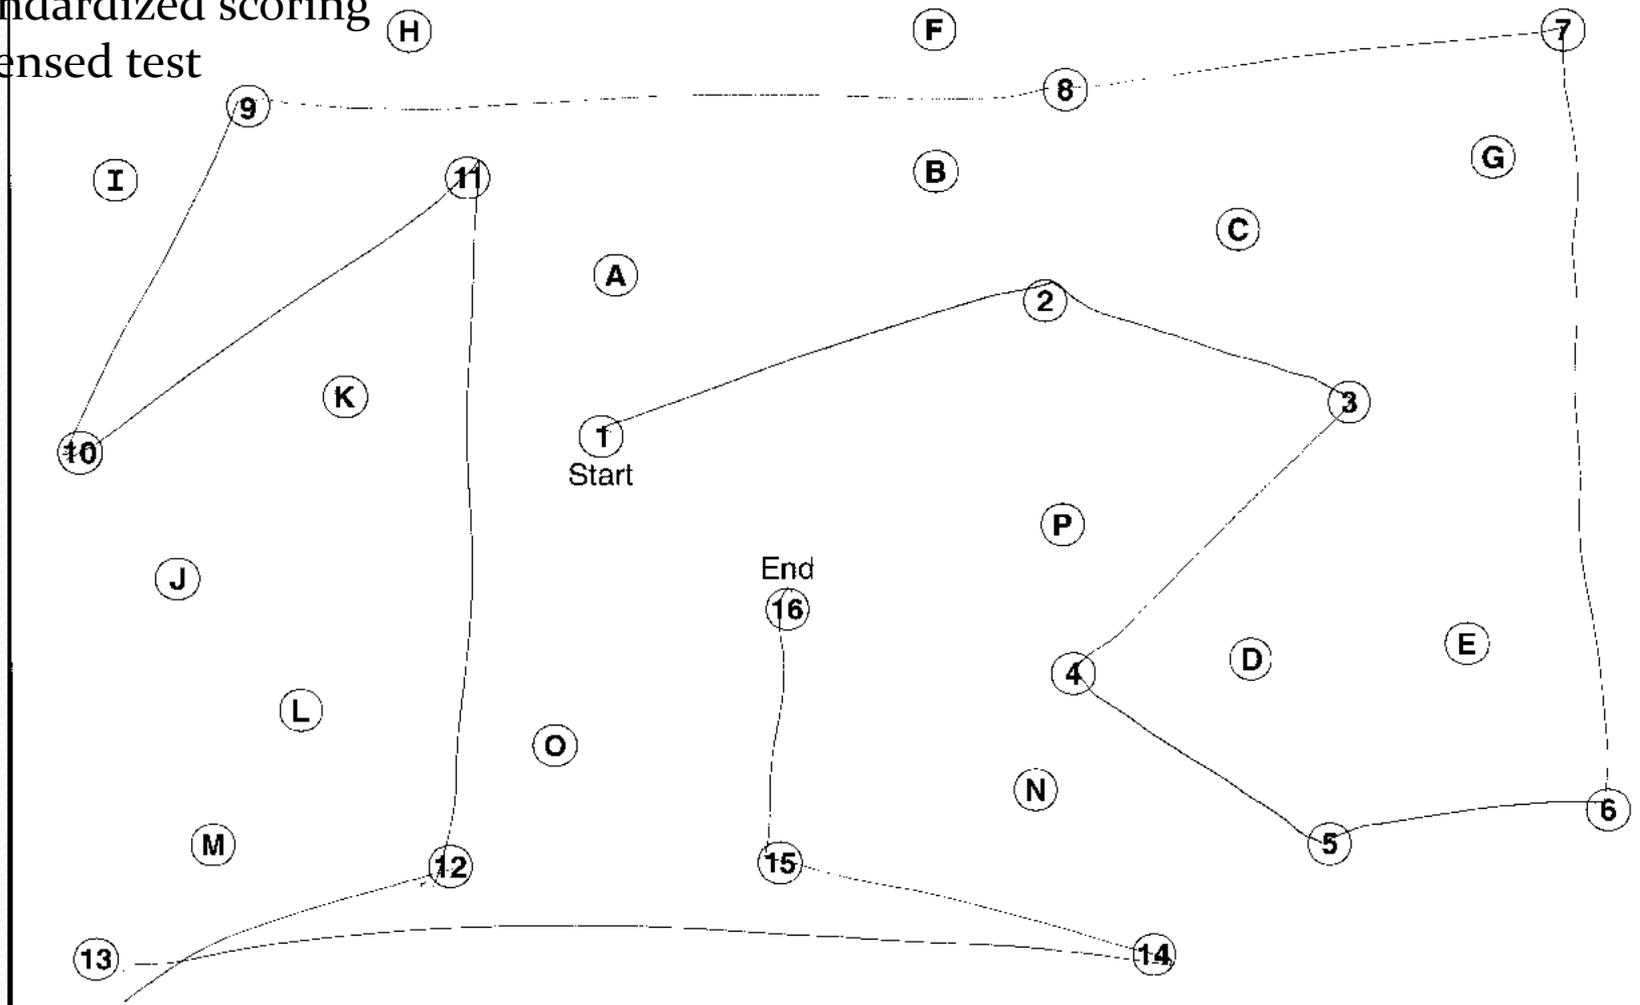

VETSA COGNITIVE MEASURES

General Cognitive Ability	Armed Forces Qualification Test Form 7a: Age 20, 55, 61
COGNITIVE DOMAINS	MEASURES (VETSA 1 & VETSA 2 unless noted)
Verbal Ability	WASI Vocabulary (55); WRAT (61)
Visual Spatial Ability	Gottschaldt Hidden Figures Card/Mental Rotation (Ekstrom, 1976)
Verbal Memory	Logical Memory (Immediate, delayed, delayed adjusted) CVLT (Short & Long Delay FR; Long Delay adjusted)
Visual Spatial Memory	Visual Reproduction Immediate, Delay, Delay adjusted
Short Term Memory	Spatial Span Forwards; Digit Span Forwards
Working Memory	Spatial Span Backwards Adjusted for SS Forward Digit Span Backwards Adjusted for DS Forward Letter Number Sequencing Adjusted for DS Forward Reading Span
Executive Functions (Switching/Interference)	Trails Switching Adjusted for Trails 2, 3 Stroop Color-Word Interference Adjusted for Stroop Word D-KEFS Verbal Fluency Switching Adj for Animal Fluency AX-CPT
Verbal Fluency	D-KEFS Letter Fluency D-KEFS Category Fluency
Abstract Reasoning	WASI Matrix Reasoning
Processing Speed	Trails Number Sequencing; Trails Letter Sequencing Stroop Word; Complex and simple reaction time

D-KEFS TRAILS: Condition 2

- Simple instructions
- Simple outcome variables (time to complete/errors)
- Standardized scoring
- Licensed test

Processing
Speed

Episodic Memory (verbal)

WMS-III

Logical Memory I --- STORY A

Emm. T a cook in Boston
robbed 1 night
\$50
p. s. to report
theft + told
story of 4 children
p. fel sorry
took up collector
to rein. \$50

Logical Memory

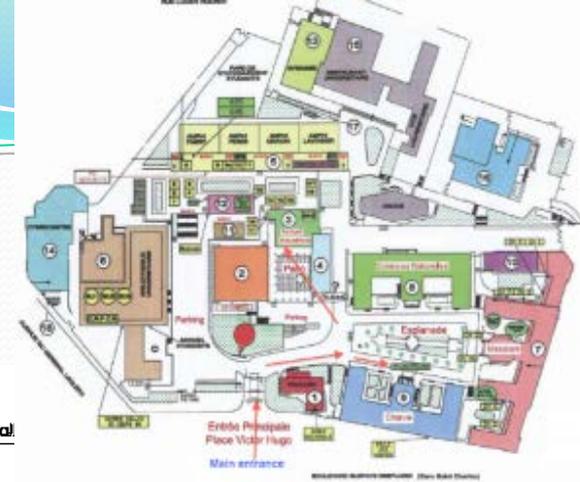

- More complex instructions
- Complex scoring system
(Proprietary—needs reference)
- Only a few variables/scores
- Any deviations from standard instructions essential to know for comparability with other studies

WMS-III

Logical Memory II (Delayed Recall) --- STORY A

Emm T was a cook
lived B
4 children
one 1 night
robbed \$50
went in + reported to po.
fel sorry
in situation w/ 4ch
came up w/ donation
to cover her loss

Visuo-spatial
Episodic
Memory
(5 cues;
3 conditions)

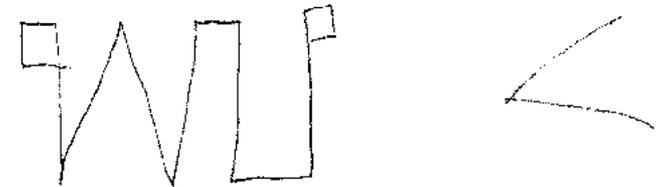

Visual Reproduction II—Copy
Design E

16

Visual Reproduction II—Recall
Item 4

10

Visual Reproduction II—Recall
Item 5

Visual Reproductions:

- Proprietary test
- Relatively brief instructions and easy administration
- Difficult but well-documented scoring system (references)
- Relatively few outcome variables
- Related but different concept to Verbal Episodic Memory

Episodic Memory (Verbal)

List A Immediate Free Recall Trial 1

I'm going to read a list of words to you. Listen carefully, because when I'm through, I want you to tell me as many of the words as you can. You can say them in any order, just say as many of them as you can. Are you ready?

Read List A at an even pace, taking slightly longer than one second per word, so the entire list takes 18 to 20 seconds. Then say: Go ahead.

- truck
- spinach
- giraffe
- bookcase
- onion
- motorcycle
- cabinet
- zebra
- subway
- lamp
- celery
- cow
- desk
- boat
- squirrel
- cabbage

Trial 1	Resp Type

mprehension sheet while you put

V2T2 Revised 09/13/2009

trial or not digit span is "good" trial.

On 10/20/09

t 2 seconds

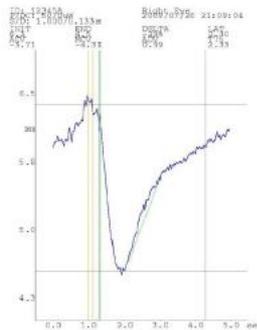

Good vs. Bad Scans – Light Reflex Test

A trial is "good" when the graph shows a smooth line that has no sudden drops or jumps (these indicate blinks or other problems with the scan).

In this recording mode, the device will automatically scan for these artifacts, and if it finds any it will turn the display red to show it's a "bad" trial.

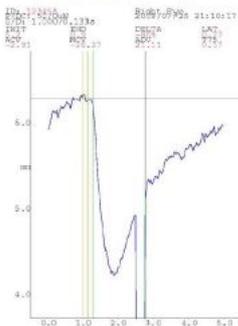

However, even if it's green, you must still check the graph. If a subject blinks late in the scan it can result in a green display, but it is still a bad trial.

Good Trial

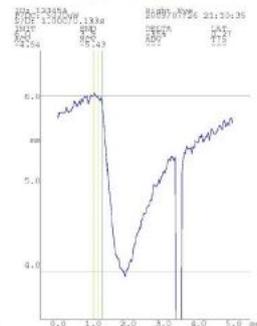

Bad Trials

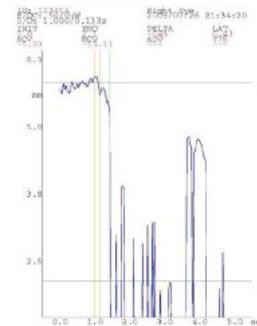

Early Blink (red display)

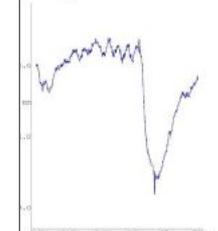

Late Blink (green display)

Dropy Eyelid

V2T2 Revised 09/13/2009

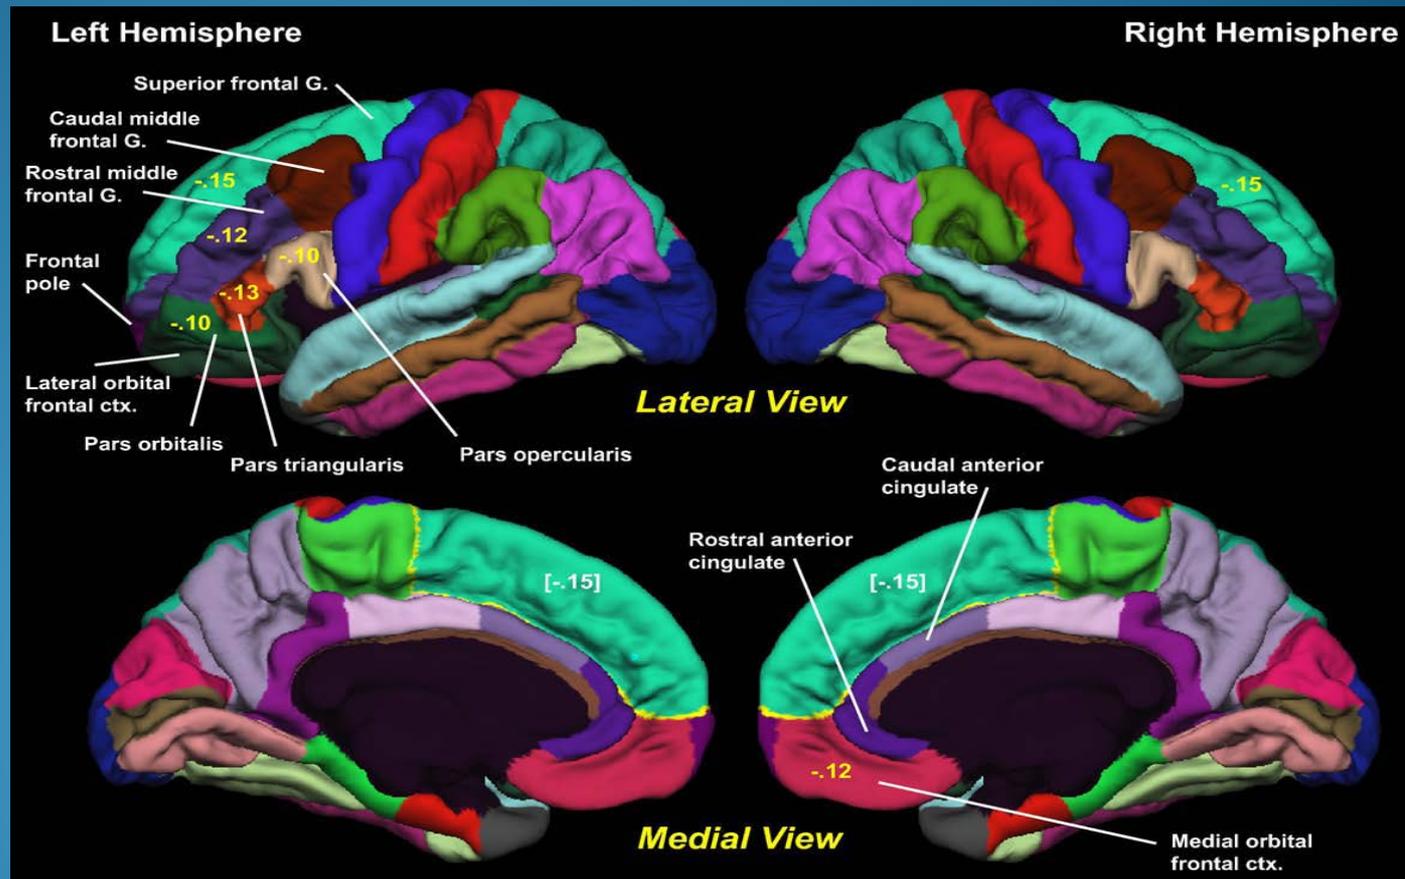

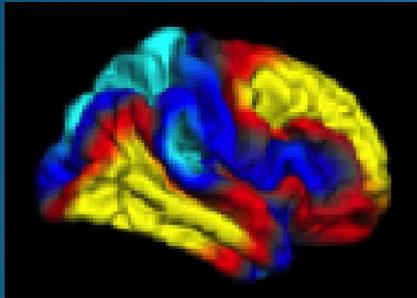

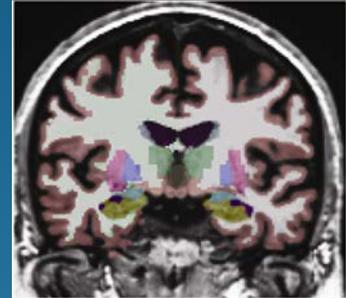

Looked at light at 9 seconds Good for 3 and 6-digit spans, Bad for 9

Neuroimaging

- VETSA 3-D Structural MRI (N=534):*

Cortisol levels across 3 nonconsecutive days in 783 VETSA participants

Challenges

- Longitudinal data
- Consortia/Harmonizing across complex studies
- Complex non-questionnaire/non-survey data
- Complicated instructions/scoring
- Large raw data sets from computerized tests, MRI, GWAS
- Syntax for computerized testing (i.e. parameters for timing, size of cues, speed of cue presentation)
- References
- Multiple concepts associated with tests
- Portions of Colectica/DDI seem disconnected that are essential to interconnect.

Closing

- When a variable—especially in a large study—is not based on a question what are the options for data capture in DDI?
 - “Shoehorning” information into the existing system
- Can DDI be all things to all people (researchers, users) or is there a breaking point where it becomes too big, too complex?
- Where do you draw the line in making data available for users?
- Spend more time with researchers...make data documentation easier and more in line with actual research.
